Introduction

Pixa is a specialised Wallet designed to protect your primary Solana wallet from potential risks associated with high-risk DeFi interactions.

Pixa empowers users to explore the Solana ecosystem without compromising their main holdings by providing a separate secure and isolated environment.

Wallet
For Everyone

Problem

While decentralised solutions offers numerous opportunities, it also present significant risks, including scams, phishing attacks and malicious contracts. User often hesitate to participate in high risk DeFi activities due to fear of loosing their funds.

Mobile DeFi access on mobile devices is cumbersome, requiring users to repeatedly open their wallets and navigate to external browsers to interact with decentralised applications.

Most wallets are not designed for efficient trading and lack speed. Many users opt for bots like Trojan and BonkBot for reliable speed. Furthermore, the client-fat nature of some wallet applications, such as Phantom, can cause lag and even device freezes, especially when monitoring an account or heavy token lists

Why Pixa
Wallet?

Solution

Pixa directly tackles the barriers to DeFi adoption by integrating advanced security to protect users from scams and malicious contracts. While also streamlining mobile access by eliminating the need to constantly switch between the wallet and external browsers for decentralized applications.

Pixa offers a new central hub for thousands of decentralized applications by allowing users to add their favorite dapps to their home screen and open them as if they were standalone apps. Furthermore, Pixa introduces a verification system for dapps and tokens, ensuring users interact with authentic and legitimate entities.

Moreover, Pixa is built for speed and efficiency, ensuring seamless trading and preventing performance issues common in other wallets, even with extensive token lists or active account monitoring.
